

CBOE Financial Network

Network Specification

Version 5.3

July 21, 2011

OVERVIEW

The CBOE Financial Network (CFN) disseminates multicast market data products to trading firms and market data vendors. The products or Data Channels available on the CFN include the Current Quote / Last Sale (CQ/LS) or “top of book” and Book Depth (BD) channels for the OneChicago Exchange (ONE) and for the CBOE Futures Exchange (CFE). The Market Data Indices (MDI) channel is comprised of various CBOE index values that are available through the CBOE subsidiary, Market Data Express (MDX).

A new set of channels called CBOE Streaming Market (CSM) is now exclusively available on the CFN. These channels provide an optimized top of book feed for five exchanges: CBOE, CBSX, CFE, ONE, and C2.

NETWORK DESIGN

The CFN uses IP multicast to efficiently and equitably distribute market data to all connected firms simultaneously. Identical copies of the data are sent to different A and B multicast groups that follow diverse network paths so that a single network outage cannot affect both sets of groups. Since there is no provision for retransmitting missed data, firms should read both A and B groups to fill in any gaps.

There are two ways for firms to connect to the CFN:

- Direct Connections
- CBOE approved Extranet Service Providers

Direct Connections

With Direct Connections, firms are responsible for ordering and managing their own WAN circuits and routers to connect to CFN. For the CBOE, CFE and ONE exchanges and MDI the primary and secondary sources for both the A and B groups are located in the CBOE facility in downtown Chicago. Two connections to this facility are required to receive the A and B groups for these channels.

If the Firm already has Direct Connections in place, these connections can also be leveraged for CFN multicast data, with some exceptions. The existing Direct Connections can be used to receive CFN multicast data only for CBSX, CFE and ONE exchanges and MDI. To receive the **CBOE CSM** multicast feed, it is **required** to order an additional pair (A & B) of 1 Gbps Direct Connections to CFN. This is required because of the inherent high traffic volume of CBOE CSM which has the potential to burst to 1Gbps.

For the C2 and CBSX exchanges, the primary and secondary sources for both the A and B groups are located in the Equinix NY4 data center in Secaucus, NJ. Two connections to this data center are required to receive the A and B groups for these channels. Existing Direct Connections at NY4 can be also be used to receive C2 and CBSX CSM multicast data. **C2 and CBSX data channels are not available from the CBOE Chicago facility and CBOE, CFE, ONE and MDI channels are not available from the Equinix NY4 data center.**

In the event of a disaster, A groups only for CBOE, CFE, ONE and MDI will be transmitted from CBOE's Disaster Recovery (DR) site in the Savvis CH3 data center. To receive these data channels in a disaster scenario a single connection to this data center is required. The C2 exchange does not have a DR site. The DR site for the CBSX exchange is the CBOE facility in Chicago.

Figure 1 shows Direct Connections to CFN in Chicago, DR and NY4.

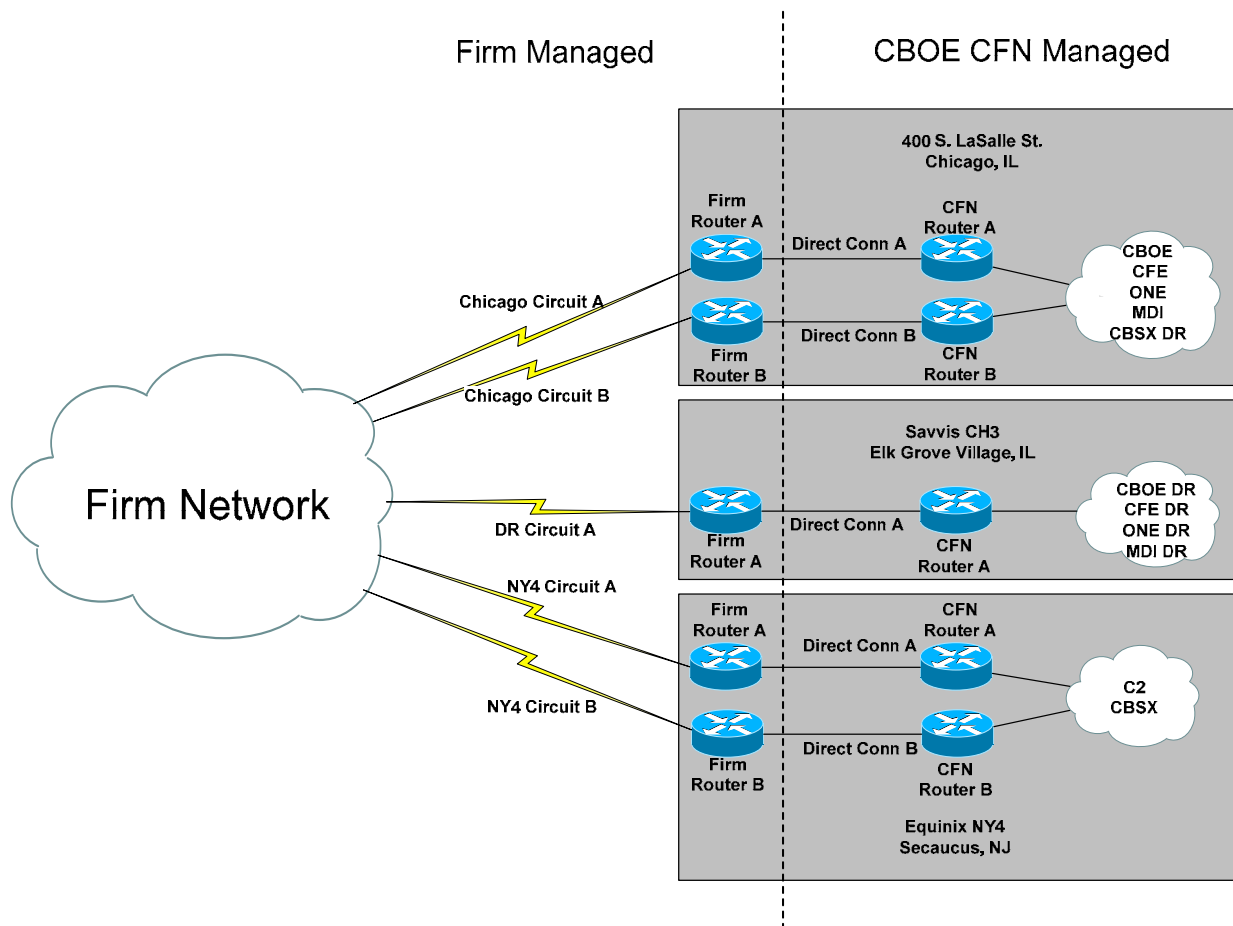

Figure 1: Direct Connections

CBOE approved Extranet Service Providers

The second type of CFN connection is via a CBOE approved Extranet Service Provider. These service providers have been approved by CBOE to transmit CFN data channels across their networks to firms. Firms only need to establish connections to the Extranet to receive the CFN data channels and not to the CBOE sites. Note, not all Extranets carry all CFN data channels or connect to all CBOE sites, e.g. DR or NY4. Please check with each Extranet for specifics. A list of CBOE approved Extranets is available at <https://systems.cboe.com/Publish/SystemsAPISite/ExtranetServiceProviders.pdf>.

Firms must complete the CFN Connection Request form at the end of this document and return it to CBOE at api@cboe.com before ordering the connection through their Extranet Service Provider representative. Extranets will not be given the approval to send CFN data channels to a firm until this form has been received by CBOE. Firms will be billed by CBOE for the data and by the Extranet Service Provider for the connectivity. For redundancy, the Firm must have two connections to the Extranet network for the A and B groups.

Figure 2 shows a sample Extranet Service Provider.

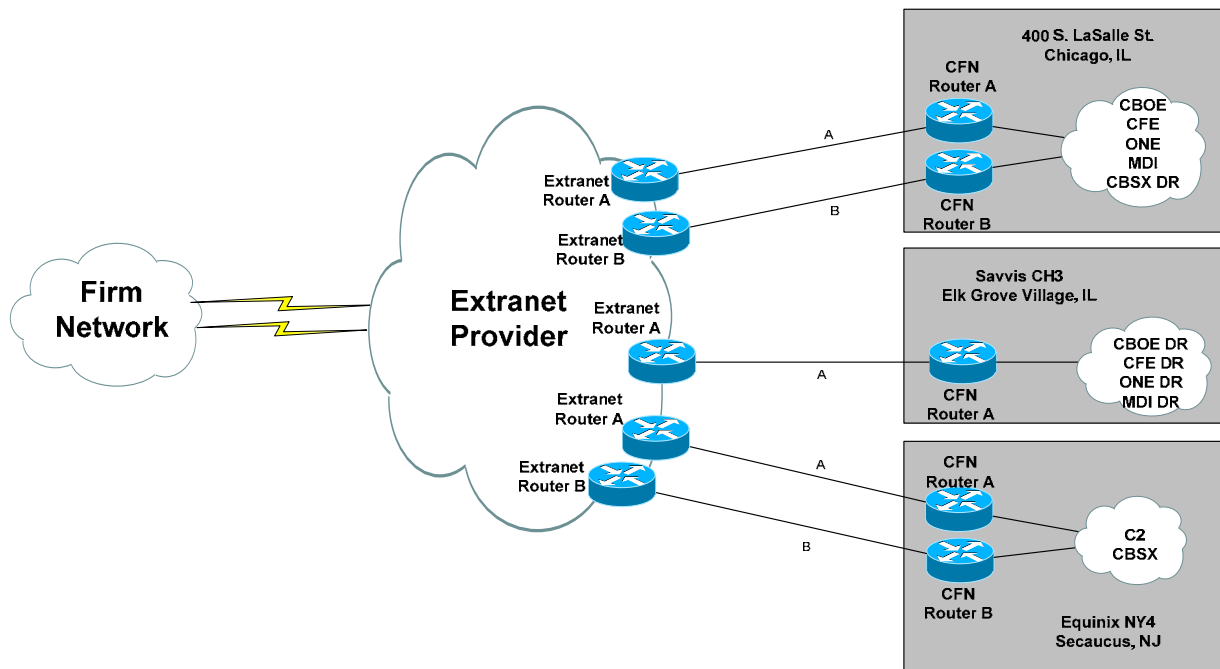

Figure 2: Extranet Service Provider Connection

DATA CHANNEL INFORMATION - PRODUCTION

For each Data Channel, shown in Table 1 below, identical data is transmitted to two sets of multicast groups – A groups and B groups, with unique multicast group IP addresses and UDP port numbers. Bandwidth for each Data Channel is based on historical peak utilization and future growth.

CFE and ONE Current Quote / Last Sale (CQ/LS)

The CFE and ONE CQ/LS data channels use one multicast group each.

CFE and ONE Book Depth (BD)

The CFE and ONE BD data channels use three multicast groups each. Products are distributed across the three groups alphabetically:

A-E - Multicast Group One

F-N - Multicast Group Two

O-Z - Multicast Group Three

Market Data Indices (MDI)

The MDI data channel uses one multicast group.

CBOE Streaming Market (CSM)

To achieve the lowest possible latency, CSM channels are not buffered. This means that each CSM group can burst up to 1 Gbps for brief periods. The duration of these microbursts will vary from one CSM channel to another. The bandwidth given in Table 1 is the observed 1 millisecond peak rate.

Please note that while each CSM channel has the potential to burst to 1 Gbps, all the CSM channels at each site combined are not allowed to burst above 1 Gbps. Therefore a 1 Gbps connection to each site will be sufficient for any and all CSM channels.

Due to the bandwidth of the CBOE CSM channel in particular and the nature of multicast traffic, it is strongly recommended that CBOE CSM not share the same circuits with unicast traffic flows if the circuit bandwidth is 1 Gbps or less.

CSM data channels are spread across multiple multicast group addresses. One or more groups in each channel are used for market data updates. Products are not distributed alphabetically across these groups. One group in each channel is for distributing security definitions. A few channels have groups reserved for future use. Please reference **Table 1A & 1B** for more details.

Table 1A: Data Channel Info for CBOE, CBSX DR, CFE, ONE and MDI

		A Groups		B Groups		
Data Channel	Bandwidth	Multicast IP Address	UDP Port	Multicast IP Address	UDP Port	Description
ONE CQ/LS	15 Mbps	233.65.120.1	52101	233.65.120.2	52102	CQ/LS

NETWORK CONFIGURATION - PRODUCTION

Direct Connections require the use of PIM Sparse Mode with static Rendezvous points (RPs). Firms will need routes to the appropriate multicast source networks and RPs listed in **Table 2**. These routes can either be configured statically or CBOE can send them via BGP. Configurations with Extranet Service Provider may be different.

CERTIFICATION AND TESTING

There is a CFN environment to test and certify CSM channels only. At this time there is no certification environment for the other data channels. Firms may listen to production CSM traffic via production connectivity or via after hours replay. Multicast traffic from the certification environment is also available through a GRE tunnel in a VPN connection. Note, the VPN for CFN testing is different from the VPN used for testing CBOE unicast APIs. **Appendix 1** contains

information on the VPN setup and a sample configuration for a Cisco router. Certification data channel and multicast information is listed in **Table 3**.

Table 2: Multicast Configuration Information

Data Channel	Group A		Group B	
	Source Network	Rendezvous Point	Source Network	Rendezvous Point
CSM for CBOE, CFE, ONE, CBSX DR Standard/Strategy	170.137.1.128/26	170.137.255.124	170.137.9.128/26	170.137.255.125
CFE/ONE CQ/LS	170.137.92.0/24 170.137.100.0/28	170.137.255.97	170.137.91.0/24	170.137.255.98/32

MDI	170.137.13.96/28 170.137.100.0/28	170.137.255.97	170.137.13.112/28	170.137.255.98/32
CSM for C2, CBSX Standard/Strategy	170.137.128.0/26	170.137.128.253	170.137.128.64/26	170.137.128.254

Table 3: Certification Environment Information

Test/Cert Data	Mcast Address	UDP Port Range	Source Network	RP
CSM API Test	233.65.120.241 233.65.120.243 233.65.120.245	64800 - 64999	170.137.253.0/24	170.137.255.14

DATA FORMATS

The CFN does not process the market data or modify the data formats in any way. For information on the specific data formats please reference the CFN documentation site, <https://systems.cboe.com/Auth/CFN.aspx>

CONTACT INFORMATION

To report a problem on an existing CFN connection, please call the CBOE Operations Department at 312-786-7642.

For all other inquiries, please send an email to api@cboe.com.

Appendix 1

CFN VPN Connectivity Guide

This guide details how to setup an IPSec VPN tunnel with CFN in order to receive multicast data for testing and certification purposes. Please complete the CFN Certification Environment Access Request form and submit to api@cboe.com.

For ISAKMP, please use:

- 3DES for key encryption
- a hash algorithm of MD5 for data integrity
- Diffie-Hellman group 2
- An SA lifetime of 86,400 seconds with no volume limit (Cisco default)
- a preshared key of (a preshared key assigned by CBOE technical staff)
- aggressive mode turned off (Cisco default)

For IPSEC, please use:

- ESP-3DES for encryption and data integrity
- a hash algorithm of ESP-MD5 for data integrity
- no compression method (Cisco default)
- a lifetime of 3600 seconds with a volume limit of 4,608,000 kilobytes (Cisco default)

The VPN Peer address for the CBOE is **198.160.148.45**

The CBOE will configure this connection during the next available maintenance window: After network connectivity has been established, please contact the API Group at CBOE for certification assistance.

API Group can be contacted as follows:

Phone: 312-786-7300

Email: api@cboe.com
